

SENSNET

Real time change.

Challenge

Enable software and web developers to easily create and quickly deploy new applications and services combining wireless sensors and mobile phones.

Solution

In a Lego like fashion, just get a variety of interchangeable capsules to match your needs as they evolve over time, or even create your own set of features. The credit card size Sensbase links sensor measurements from capsules to your phone via Bluetooth. On the software side, our web 2.0 SensNet software platform serves both for sensor data transmission and real time visualization, so you can instantly be part of new mobile Internet applications. Browser based solutions already exist for various capsules (e.g. Gaming, City, Wellness, Sports).

Sensaris

Results

Instant messaging based communication for sensors ties the physical world to the mobile Internet. Solutions adapted to personal lifestyles encourage interaction and act as spaces for conversation, and the dissemination/sharing of information. Data mining and analysis reveals invisible links and dynamics.

Target Markets

Innovators wanting to provide engaging sensor driven applications across mobile devices. Companies and developers looking for ways of empowering people with new web based mobile applications and plug and play sensing accessories compatible with 2 billion phones.
